

Turn every SOW promise into proof a client can approve.

For web agencies that need a clear approval trail.

BLUEPRINT HACKATHON

One Statement of
Work (SOW)
Six clear checks
One approval trail

The work may be finished, but the approval trail is scattered.

01

Scope

The promise starts in the SOW.

02

Proof

Screenshots and test results end up somewhere else.

03

Decision

The approval gets buried in email or chat.

04

Billing

By invoicing time, the evidence trail is gone.

Greenlit keeps the promise, proof, decision, and
invoice handoff together.

The same promise stays connected from contract to approval.

Your team confirms the criteria, the browser checks the work, and your client makes the call.

Greenlit starts with agencies that get paid by milestone.

WHO WE START WITH

**Web, product, and
creative agencies with
10–50 people**

BUYER

Agency owner, delivery lead, or account lead

PAIN

Proof, approval, and billing live in different tools.

99,391

U.S. employer establishments across three adjacent categories

68,051	Custom computer programming
15,828	Graphic design
15,512	Advertising agencies

At \$200/month: about \$239M/year (illustrative)

A polished success message is not proof.

The test site says the form worked even though the request returned 500. Greenlit records that failure alongside the exact criterion.

AC-04 · FAILED CHECK

The page showed success, but the server returned HTTP 500.

Synthetic walkthrough evidence; no retained transaction was created.

The client sees the promise, not a test dashboard.

The original SOW clause

Expected result and actual result

Evidence and the deadline

Approve or request changes

The walkthrough ends in an invoice-ready sample.

The sample receipt keeps the milestone value, revision, observed build, and local-only decision in one place.

What it is

A printable summary of the approval and invoice handoff.

What it is not

A signature, certification, payment record, or guarantee.

The architecture keeps drafting, browser checks, and approval separate.

Gemini drafts. People confirm. The runner observes. The client decides.

Four boundaries keep AI in its lane.

01

Selected text only

Gemini sees only the source text needed to draft.

02

Human confirmed

Nothing runs until a person approves the criteria.

03

Typed and signed

The runner gets allowlisted checks and a signed job ID.

04

Private evidence

Results stay in Supabase with expiring access.

AI proposes the criteria. People approve them. Every run stays repeatable.

Built during the hackathon, tested end to end.

Build	Built from scratch during Blueprint 2026 as a full agency-to-client flow.
Verify	Typecheck, lint, tests, build, migrations, and browser flows all passed.
Explore	Try the live walkthrough, then review the source and architecture.
